

IHS Advanced Resonance Analysis

\$360.00 USD

Simply using a pad placed either on the foot or tailbone overnight, we are able to noninvasively analyze the toxins present in one's body. Price includes lab analysis and a written toxicologist's report by Dr. Hildegarde Staninger, RIET-1. This test helps to recognize substances in one's body so that a targeted detoxification program can be tailored accordingly.

The Advanced Resonance Patch Test is a non-invasive, (no needles, bloodwork or biopsy), cost effective way to determine one's baseline health. Environmental stress factors tested for include over 700 chemicals per US EPA Priority Pollutants; radioactive isotopes; advanced nanomaterials and KD-proteins via Advanced Resonance Analysis (ARA). The lab results document an individual's environmental exposures. This test is an ideal method for an individual to establish a baseline for preventive and systemic toxicological purposes. As it is noninvasive, this is also an ideal method to use on infants and children.

HOW TO USE: Apply the patch over the sole of your foot OR on your tailbone prior to bedtime. Do not bathe or shower. In the morning, place the saturated pad into a sealed ziplock baggie.
