

## The Amazing Gas Mojo™

*This Phenomenal Device Produces  
Up To 25% Fuel Savings On ANY Car Or Truck!*

***EZ to Install • No Moving Parts • No Tools Needed • Guaranteed***

### Useful Tips Before Purchasing Or Installing Gas Mojo

<http://www.gasmojo.com>

- 1) Make sure your vehicles engine is in good running condition.
- 2) If you do only city driving keep track of how many gallons of fuel you normally use and the miles you drive. Do the same if you drive combined city / highway miles. Do not rely on average miles on your car computer. It may not always give accurate readings.
- 3) Before installation on vehicles with automatic transmission notice how smooth the vehicle shifts. Most cars and truck transmissions tend to have a surge hesitation before shifting into the next gear. After the installation of the Gas Mojo you will notice it shifts smoother into each gear and at lower RPM .This is one way to show the Gas Mojo is working.
- 4) Before installation take a reading of tachometer or RPM gauge when engine is warmed up with transmission in park position. If it reads 600 RPM or above you will see a drop in RPM after installing the unit and driving about 5 miles. This shows that the unit is working properly.
- 5) Most autos and trucks have rear brake lines and fuel lines running down the same side of the vehicle going toward the engine which may be confusing at first. If you are not sure which are brake lines and which are fuel lines go to the parts department of the local dealer. Ask for a print out of the fuel lines for your car or truck. This only takes a few minutes and will help prevent an improper installation which is the only way this device will not work.
